Simply easy!™

Optimise detection with XX range

Detect objects in challenging applications with our XX ultrasonic sensors range. These ultrasonic sensors offer an efficient solution for reliable and high performance detection at distances of up to 8 m, on window mode*.

* The window mode enables suppression of the foreground and the background using the same sensor.

> A technology suited to your needs

Detect objects regardless lightning conditions or material reflectivity degree.

> 3 operating modes for efficient detection

Ideal for detecting irregular-shaped objects.

> Short or long distance detection

From 50 mm up to 8 m.

> A technology suited to your needs

Ultrasonic sensors enable non-contact detection of objects in many kinds of industrial environment, irrespective of :

- material (metal, plastic, wood, cardboard, etc.),
- nature (solid, liquid, powder, paste, etc.),
- colour,
- degree of transparency.

The ultrasonic sensors are simple to install; they feature integrated connectors, or cable versions in select models, and offer a wide range of cabling and mounting accessories for a seamless integration.

> 3 operating modes for efficient detection

Diffuse mode

An object reflects the ultrasonic wave back to the sensor which, in turn, changes the output state.

This operating mode is well suited for detecting objects with flat surfaces that are positioned perpendicularly to the direction of the ultrasonic beam.

Reflex mode

The sensor is permanently detecting a fixed background (previously taught) on a machine or application. When another object breaks the ultrasonic beam, the output changes its state.

Well suited for detecting objects that absorb the ultrasonic waves (sponges, etc.) or that do not reflect the wave back to the sensor (non-flat surfaces, pointy or irregular-shaped objects).

Thru-beam mode

The transmitter is constantly sending an ultrasonic wave to the receiver. When an object breaks the ultrasonic beam, the output changes its state.

Well suited for small object detection and applications where higher accuracy and faster response time are required.

> Long distance proximity detection

Ultrasonic technology allows now for long distance proximity detection. The XXV Ø18 ultrasonic sensors enable detection from 0 to 50 mm (i.e. 2.5 times farther than standard inductive proximity sensors) with minimal environment constraints or object material and colour restrictions.

Sensors mounted too close to moving-metal parts are exposed to hits or impacts which can cause machine downtime. Being able to install sensors farther away from moving targets reduces the exposure to potential incidents. You increase installation profitability!

x 2.5
detection distance

inductive proximity
sensors

XXV Ø 18 sensor

Standard inductive proximity sensor

The XXV ultrasonic sensor is a “Plug and Play” solution with no adjustment or teaching required. Its solid-state output changes state when an object is less than 50 mm away from the sensor face.

Its accurate and well-defined transmission angle enables precise detection. Crosstalk with other sensors and object edge effects are mastered.

Quality, standards and certifications

Quality control

The XX ultrasonic sensors models are subjected to special precautions in order to guarantee their reliability in arduous industrial environments.

■ Qualification

A **qualification procedure** on the characteristics of XX range ultrasonic sensors is carried out in our laboratories.

■ Production

The electrical characteristics and the sensing distances at the ambient and operating temperatures are 100% verified.

Sensors are statistically selected during the course of production and subjected to **monitoring tests** on all qualified characteristics.

■ Customer returns

Returned ultrasonic sensors are subjected to systematic analysis and corrective actions are implemented to eliminate recurrence of the fault.

Conformity to standards

The XX ultrasonic sensors models conform to the standards IEC 60947-5-2.
Standards and characteristics: refer to pages 23, 27, 32, 38, 41, 45, 46, 50, 54 and 58.

Resistance to chemicals in the environment

To ensure lasting efficient operation, it is essential that any chemicals coming into contact with the ultrasonic sensors will not affect their casing and, in doing so, prevent their reliable operation.

Due to the materials used, the XX ultrasonic sensors models are very resistant to:

■ Chemical agents:

salts, aliphatic and aromatic oils,
petroleum, diluted bases and acids.

Depending on their nature and concentration, tests should be carried out beforehand for the following chemical agents:

alcohols, ketones and phenols.

■ Food and beverage industry products:

vegetable oils, animal fats,
fruit juices,
milk proteins, etc.

Resistance to the environment

■ IP 65: protection against water jets.

Tested in accordance with IEC 60529: the device is subjected to water sprayed from a Ø 6.3 mm nozzle, at a flow rate of 12.5 litres/min for 3 min at a distance of 3 m.
No deterioration in either operating or insulation characteristics is permitted.

■ IP 67: protection against the effects of immersion.

Tested in accordance with IEC 60529: the sensor is immersed for 30 minutes in 1 m of water.
No deterioration in either operating or insulation characteristics is permitted.

■ IP 69K: protection against the effects of high pressure cleaning. Adherence to standard

DIN 40050 which stipulates that the product must withstand a water jet at a pressure of 90 bar and temperature of +80°C for 3 minutes.

No deterioration in either operating or insulation characteristics is permitted.

Recommendations

The ultrasonic sensors are designed for use in standard industrial applications involving presence detection.
 Since these sensors do not incorporate a redundant electrical circuit, they are not suitable for use in safety applications.
 For safety applications, please refer to our website www.tesensors.com

Principle of ultrasonic detection

Presentation

Ultrasonic sensors enable detection, without contact, of objects irrespective of its:

- material (metal, plastic, wood, cardboard, etc.),
- nature (solid, liquid, powder, etc.),
- colour,
- degree of transparency.

They are used in industrial applications for detecting, for example:

- the position of machine parts,
- the presence of the windscreen during automobile assembly,
- the flow of objects on a conveyor system: glass bottles, cardboard packages, cakes, etc.,
- the level
 - of different colour paints in pots,
 - of plastic pellets in injection moulding machine feeders.

The ultrasonic sensors are simple to install due to their integral connector and availability of cabling and fixing accessories.

Operating principle

The principle of ultrasonic detection is based on measuring the time taken between transmission of an ultrasonic wave (pressure wave) and reception of its echo (return of transmitted wave).

The XX ultrasonic sensors models comprise:

- 1 a high voltage generator
- 2 a piezoelectric transducer (transmitter and receiver)
- 3 a signal processing stage
- 4 an output stage

Excited by the high voltage generator **1**, the transducer (transmitter-receiver) **2** generates a pulsed ultrasonic wave (200 to 500 kHz depending on the product) which travels through the ambient air at the speed of sound. When the wave strikes an object, it reflects (echo) and travels back towards the transducer. A micro controller **3** analyses the signal received and measures the time interval between the transmitted signal and the echo. By comparison with the preset or taught times, it determines and controls the output states **4**.

The output stage **4** controls a solid-state switch (PNP or NPN transistor) corresponding to a NO or NC contact (detection of object).

Advantages of ultrasonic detection

- No physical contact with the object to be detected, therefore, no wear and detection possible of fragile and/or freshly painted objects, etc.
- Detection of materials, irrespective of colour, at the same distance, without adjustment or correction factor.
- Teach mode function, by simply pressing a button, for defining the effective detection zone. Teaching of the minimum and maximum sensing distances (very precise foreground and background suppression, ± 6 mm).
- Very good resistance to industrial environments (robust products entirely encapsulated in resin).
- Solid-state units: no moving parts in the sensor, therefore, service life independent of the number of operating cycles.
- Various types of outputs to suit requirements:
 - Digital output for level control or detection of any type of object
 - Analogue output for controlling systems that require a signal that is proportional to the distance at which the object is detected.

Terminology

PR = drop-out point
PE = pick-up point

Definitions

The terms listed below are defined by the standard IEC 60947-5-2:

■ **Nominal sensing distance (Sn)**
Conventional value for indicating the sensing distance. It does not take into account manufacturing tolerances nor variations caused by external conditions such as voltage and temperature.

■ **Detection zone (Sd)**
Zone in which the sensor is sensitive to objects.

■ **Minimum sensing distance**
Lower limit of the specified detection zone.

■ **Maximum sensing distance**
Upper limit of the specified detection zone.

■ **Assured operating distance (Sa)**
This corresponds to the operating zone of the sensor (activation of outputs), and is included in the detection zone. It is also known as the "detection window".
Its limits are fixed:

- at the factory for fixed sensing distance sensors,
- when setting-up within the application for sensors with teach mode.

■ **Blind zone:** Zone located in front of the sensing face of the sensor.
For diffuse sensors, it is the zone in which the object will not be reliably detected.
For reflex sensors, it is the zone in which the target (fixed background of machine for example) will not be reliably detected, but the object can be in this zone.
For thru-beam sensors, there is no blind zone.

■ **Differential travel**
The differential travel (H) or hysteresis is the distance between the pick-up point as the standard metal target moves towards the sensor and the drop-out point as it moves away from the sensor.

■ **Repeat accuracy**
The repeat accuracy (R) is the precision of reproduction between two successive measurements of the sensing distance, made in identical conditions.

■ **Overall beam angle**
Fixed angle around the reference axis of an ultrasonic proximity sensor.

■ **Standard metal target**
The standard IEC 60947-5-2 defines the standard target as a square metal plate, 1 mm thick with rolled finish, placed perpendicularly to the reference axis.
Its side dimension depends on the detection zone:

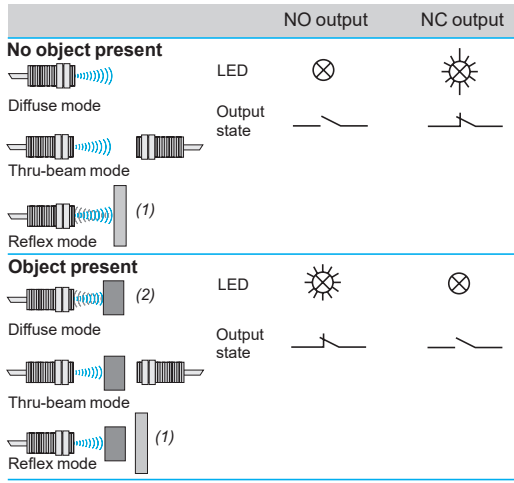

Detection zone (mm)	Size of target (mm)
< 300	10 x 10
300 < d < 800	20 x 20
> 800	100 x 100

■ **Voltage drop (Ud)**
The voltage drop (Ud) corresponds to the voltage at the terminals of the sensor when in the closed state (value measured at the nominal current of the sensor).

■ **First-up delay**
Time required to ensure operation of the sensor's output signal following power-up.
1 Power-up
2 Output signal state (0 or 1)

■ **Response time**
Response time (Ra): time taken between the instant the object to be detected enters the active zone and the changing of the output signal state. This time limits the passing speed of the target in relation to its dimensions.
Recovery time (Rr): time taken between the object being detected leaving the active zone and the changing of the output signal state. This time limits the interval between 2 objects.

Digital outputs

(1) Fixed background of machine
(2) Object

LED indicators

The majority of XX ultrasonic sensors models incorporate light-emitting diode output state indicators.

- Ø 12 sensor
 - Green LED (power on)
 - Yellow LED (object present)
- Ø 18 sensor, sensitivity 500 mm (except thru-beam versions XXT18 and XXR18)
 - Yellow LED (object present) or green LED (power on) + user assistance when adjusting the detection zone
- Ø 30 sensor
 - Multicolour LED for assisting the user when adjusting the detection distance
 - Yellow LED (object present)
 - Analogue version with LED (object present, with luminosity increasing as output signal increases)
- Parallelepiped format sensor
 - XX●F: Dual colour yellow (object present) or green (power on) LED
 - XX●V: Dual colour yellow (object present) or green (power on) LED + user assistance when adjusting the detection zone
 - XX7K: Yellow LED (object present); green LED (power on)
 - XXTK: Yellow LED (object present) only
 - XX●D: Yellow LED (object present); green LED (power on)
 - Analogue version with LED (object present, with luminosity increasing as output signal increases)

Sensors with digital switching

Output contact logic

- NO contact (normally open)
Corresponds to a sensor whose output changes to the closed state when an object is present in the detection window.
- NC contact (normally closed)
Corresponds to a sensor whose output changes to the open state when an object is present in the detection window.

4-wire technique

NO output/PNP and NPN

NO + NC output/NPN

NO + NC output/PNP

These sensors comprise 2 wires for the supply and 1 wire for each output signal

3-wire technique

NO output/NPN

NO output/PNP

These sensors comprise 2 wires for the supply and 1 wire for the output signal,

- PNP type:** switching the positive side to the load.
- NPN type:** switching the negative side to the load.

Sensors with analogue output

Operation

The characteristic feature of these sensors is the output which delivers a signal (either current or voltage) that is proportional to the distance of the object being detected. Within the detection limits, which are adjustable using teach mode, the value of the output signal increases or decreases in relation to the distance of the object. When an object is detected, an LED indicator (D) illuminates and its luminosity increases in relation to the value of the output signal. The slope of the signal can simply be changed by pressing the teach button

Advantages

- Visual information available relating to the sensor/object distance.
- Protection against reverse polarity.
- Protection against overloads and short-circuits.
- No residual current, low voltage drop.

Power supply

Sensors for DC circuits

- **DC source:** Check that the voltage limits of the sensor and the acceptable level of ripple, are compatible with the supply used.
- **AC source** (comprising transformer, rectifier, smoothing capacitor): The supply voltage must be within the operating limits specified for the sensor.

Where the voltage is derived from a single phase AC supply, the voltage must be rectified and smoothed to ensure that:

- the peak voltage of the DC supply is lower than the maximum voltage rating of the sensor.
- Peak voltage = nominal voltage $\times \sqrt{2}$
- the minimum voltage of the supply is greater than the minimum voltage rating of the sensor,

given that:

$$\Delta V = (I \times t) / C$$

$$\Delta V = \text{max. ripple: } 10\% (V),$$

I = anticipated load current (mA),

t = period of 1 cycle (10 ms full-wave rectified for a 50 Hz supply frequency),

C = capacitance (μF).

As a general rule, use a transformer with a lower secondary voltage (U_e) than the required DC voltage (U).

Example:

18 V \sim to obtain 24 V \dots ,

36 V \sim to obtain 48 V \dots .

Setting-up precautions

For diffuse sensors:

Mounting

Mounting distance between ultrasonic sensors

If 2 standard sensors are mounted too close to each other, the wave transmitted by one sensor is likely to interfere with the other and result in erratic operation.

In order to avoid this, it is necessary to adhere to the minimum distances between sensors. See setting-up precautions.

Maximum tightening torque

Cylindrical sensors	Diameter mm	Tightening torque	Flat sensors	Screw	Tightening Torque
XX●12●	Ø 12	0.7 N.m/ 0.52 lb-ft	XX●F●	M3	0.7 N.m/ 0.52 lb-ft
XX●18●	Ø 18	1 N.m/ 0.74 lb-ft	XX●K●	M4	1 N.m/ 0.74 lb-ft
XX●30●	Ø 30	1.35 N.m/ 1 lb-ft	XX●V●	M3	0.7 N.m/ 0.52 lb-ft
XX●V3●	Ø 30	1.35 N.m/ 1 lb-ft		Ø 18	1 N.m/ 0.74 lb-ft
XXS18*	Ø 18 (Plastic)	2 N.m /			
XXA18*		1.47 lb-ft			
	Ø 18 (Metal)	15 N.m /			
		11.06 lb-ft			

Interchangeability

Interchangeability is made easy by using **indexed** fixing clamps:

- XSZB112 (Ø 12 mm),
- XSZB118 (Ø 18 mm),
- XSZB130 (Ø 30 mm),
- XXZB118 (Ø 18 mm),

XSZB1●●

Cabling

Electrical connection

- **Connect the sensor before switching on the supply**

- **Length of cable**

No limitation up to 200 m or up to a line capacitance of $< 0.1 \mu\text{F}$.

It is, however, advisable to take into account the voltage drop on the line.

- **Separation of control and power cables**

The sensors are immune to electrical interference encountered in normal industrial conditions. Where extreme conditions of electrical "noise" could occur (large motors, spot welders, etc.), it is advisable to protect against transients in the normal way:

- suppress interference at source,
- separate power and control wiring from each other,
- smooth the supply,
- limit the length of cable.

Setting-up precautions (continued)

Connection in series

This connection method is not recommended.

- Correct operation of the sensors cannot be assured and, if this method is used, tests should be made before installation.

The following points should be taken into account:

Sensor 1 carries the load current in addition to the no-load current consumption values of the other sensors connected in series. For certain models, this connection method is not possible unless a current limiting resistor is used.

When in the closed state, each sensor will produce a voltage drop and, therefore, the load voltage should be selected accordingly.

As sensor 1 closes, sensor 2 will not operate until a certain time "T" has elapsed (corresponding to the first-up delay) and likewise for the following sensors in the sequence.

"Flywheel" diodes should be used when the load being switched is inductive.

Sensors and units in series with an external mechanical contact

- The following points should be taken into account:

When the mechanical contact is open, the sensor is not supplied.

When the contact closes, the sensor will not operate until a certain time "T" has elapsed (corresponding to the first-up delay).

Connection in parallel

- No specific restrictions. The use of "flywheel" diodes is recommended when an inductive load (relay) is being switched.

Capacitive load (C > 0.1 mF)

- At switch-on, it is necessary to limit (by resistor) the charging current of the capacitive load C. The voltage drop in the sensor can also be taken into account by subtracting it from the supply voltage for calculation of R.

$$R = \frac{U \text{ (supply)}}{I \text{ max. (sensor)}}$$

Load comprising an incandescent lamp

- If the load comprises an incandescent lamp, the cold state resistance can be 10 times lower than the hot state resistance. This can cause very high current levels on switching. Fit a pre-heat resistance in parallel with the sensor.

$$R = \frac{U^2}{P} \times 10, U = \text{supply voltage and } P = \text{lamp power}$$

Detection

Influencing factors

The ultrasonic sensors are particularly suited for the detection of objects that are capable of reflecting an acoustic wave and, in general, having a flat surface perpendicular to the detection axis. However, the correct operation of the ultrasonic sensor can be disrupted by:

- air currents, which can accelerate or divert the acoustic wave transmitted by the sensor (ejection of part by air jet),
- high temperature gradients within the detection zone: an object emitting considerable heat can create zones of varying temperature that will modify the propagation time of the wave and thus prevent reliable operation,
- sound insulators: sound absorbing materials (cotton, fabrics, rubber, etc.),
- the angle between the face of the object to be detected and the reference axis of the sensor: when the angle is offset from 90°, the wave is no longer reflected back along the sensor axis and the operating distance is reduced. The greater the distance between the sensor and the target, the greater the effect. Detection is not possible when the angle exceeds $\pm 10^\circ$.
- the shape of the object to be detected: similar to the example above, an excessively angular object can be difficult to detect 1. In this case, use reflex mode detection.

Detection systems

Diffuse mode

In this mode, it is the object itself that reflects the ultrasonic wave back to the sensor which, in turn, switches its output. It is the most widely used and the most simple mode. In this mode, the object will not be detected in the blind zone.

Reflex or beam break mode

The sensor is in a permanently detecting state on a fixed background of the machine and when the object to be detected breaks the acoustic beam the output switches state 2. This mode is particularly recommended in cases where the shape of the object changes (irregular, angular, non perpendicular) and also for objects that absorb sound (see above). This mode can be achieved by using a diffuse mode sensor (with background teaching) or, more simply, by using a ready to use reflex mode sensor.

In cases where space is restricted, a reflector 3 and 4, angled at 45°, can be used. This system can be used for both the diffuse and reflex modes. This reflector can be a flat part of the machine or a separate element. In this mode, the background of the machine must not be within the blind zone. But if the object is within this zone, it will be reliably detected.

Thru-beam mode

Detection is achieved using both a transmitter and receiver, with the transmitter permanently transmitting an acoustic wave to the receiver. The breaking of the beam by the presence of an object switches the output of the receiver. This mode provides long detection distances 5. In this mode there is no blind zone.

Ultrasonic sensors

XX range, Wide Beam

Obstacle detection system for mobile equipment.

Configurable by software

Wide Beam ultrasonic sensors

Telemecanique Sensors has expanded its range of ultrasonic sensors with the "XX Wide Beam" offer to meet the specific needs of mobile equipment such as:

- Lift trucks
- Cherry pickers
- Mobile elevating work platforms
- Self-propelled ride-on handling trucks
- Ground support equipment
- Aircraft access platforms, etc.

These sensors are designed to detect the following kinds of obstacles when mobile equipment is lifting or rotating: ceilings, beams, cables, scaffolding, other platforms or buckets, etc.

Compact and flush mountable in metal, these sensors are easy to install with:

- A remote Deutsch DTM04 connector on a 0.15 m cable, or
- A remote M12 connector on a 0.15 m cable, or
- A 0.5 m cable

They operate silently and are also suitable for indoor use.

The XX configuration software makes these sensors easy to program.

The synchronization function is used to reduce interference between sensors, even when installed close to each other, thus helping to ensure objects are detected over a wide area.

Important: This device does not have a Performance Level or Safety Integrity Level or any other type of capability with regard to functional safety.

For safety applications, visit our website: www.tesensors.com

Compact solution for detecting obstacles

Certified

- > E2 according to UN Regulation 10R-06
- > cULus

Obstacle detection system

- > **Wide detection area:** Fewer sensors are needed to cover a given area.
- > Better tilt angle for enhanced detection of targets and surfaces, even those that are slightly reflective or curved
- > **Rugged sensors suitable for use in harsh environments**
- > Operation in temperatures as low as -40 °C with no adverse impact on detection capability
- > Thermoplastic UV-resistant front face that can tolerate potential damage caused by building materials or bad weather
- > IP69K rating for high-pressure washdown
- > **Noise detection capability to assist the user**
- > The sensor is equipped with a noise detection function that is enabled by default. When noise detection is enabled, the sensor's analog output emits 2 mA or 5 volts, depending on model (100 for CANJ by default), when it detects excessive environmental noise.
- > Noise detection settings can be changed using the configuration interface and software (see page 78).

General characteristics				
Conforming to standards	EN/IEC 60947-5-2, UL 60947-5-2 and CSA C22.2 n° 60947-5-2			
Compliance with regulations	CE (based on the EMC directive 2014/30/UE), NEC (ANSI/NFPA 70), CEC (CSA C22), UNECE R10			
Product certifications	UKCA, E2, cULus			
Nominal sensing distance (Sn)	m	0.425...3		
Blind zone	mm	425		
Detection window	Adjustable using XX configuration software, up to 4 m			
Transmission frequency (transmitter resonance)	kHz	48		
Differential travel	mm	< 20		
Repeat accuracy	0.1 %			
Sensor accuracy	2 %			
Minimum size of object to be detected	Cylinder Ø 10 mm up to a sensing distance of 3 m			
Tilt angle with 500 x 500 mm target	± 6° at 4 m, ± 10° at 3 m, ± 45° at 1.5 m			
Materials	Casing	PBT (Valox), UV resistant		
	Sensing face	PEI (ULTEM) with PUR coating, UV resistant		
Fixing method	Using 2 M4 screws (not provided). 2 x Ø 4.32 mm stainless steel inserts and silicone washers are provided with the sensor. Tightening torque ≤ 3 Nm (26.6 lb-in)			
Connection	By remote Deutsch DTM04 6-pin connector, on 0.15 m Ø 6 mm TPU cable		By 0.5 m Ø 6 mm TPU cable CSA: 5 x 0.34 mm ²	
Power supply characteristics				
Rated supply voltage (Ue) with protection against reverse polarity	V	12...24 V $\overline{\text{---}}$. Powered by a dedicated safety extra low voltage (SELV) or a protected extra low voltage (PELV)		
Voltage limits (including ripple)	V	$\overline{\text{---}}$ 9...32		
Current consumption, no-load	mA	< 50		
Output characteristics				
Indicator lights	Output status	1 yellow LED		
	Power supply and echo status	1 two-tone LED (white and green). White: power on; green: echo status		
Switching capacity	mA	< 100 (with overload and short-circuit protection)		
Resistive load impedance		≥ 2 K Ω	≤ 250 Ω (12 V), ≤ 850 Ω (24 V)	≥ 2 K Ω ≤ 250 Ω (12 V), ≤ 850 Ω (24 V)
Voltage drop	V	< 2		
Internal temperature compensation	Yes			
Maximum switching frequency	Hz	1.6		
Delays	First-up	ms	400	
	Response	ms	300	
	Recovery	ms	300	
Environmental characteristics				
Degree of protection	Conforming to IEC 60529 and EN/IEC 60947-5-2	IP 65, IP 67, IP 69K		
Storage temperature	°C	- 40...+ 85		
Operating temperature	°C	- 40...+ 70		
Relative humidity	< 95%, non-condensing			
Vibration resistance	Conforming to IEC 60068-2-6	Amplitude ± 1 mm (f = 10...55 Hz)		
Mechanical shock resistance	Conforming to IEC 60068-2-27	30 gn, duration 11 ms, in all 3 axes		
Immunity to electromagnetic interference	Conforming to EN/IEC 60947-5-2

XXW54P3HPL01DM6, XXW54P3APL01DM6, XXW54P3HPL01M12, XXW54P3APL01M12, XXW54P3HPL05

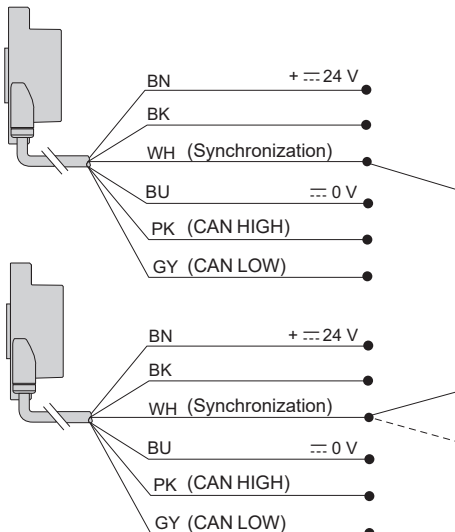

Note: Synchronization is recommended if more than one sensor is used in the same direction in order to avoid any interference between sensors due to the width of their beam.

Up to 8 sensors can be synchronized to operate side by side by electrically connecting all pin no. 6 (gray) wires together.

All sensors must be the same model and have the same cycle time setting.

XXW54P3JL01DM6, XXW54P3JL05

Note: Synchronization is recommended if more than one sensor is used in the same direction in order to avoid any interference between sensors due to the width of their beam.

Up to 8 sensors can be synchronized to operate side by side by electrically connecting all pin no. 4 (white) wires together.

All sensors must be the same model and have the same cycle time setting.

XX Configuration Software

Telemecanique Sensors is now offering a solution for configuring ultrasonic XX range sensors. This software enables users to quickly find the optimal sensing solution for their applications. An interface unit connects the sensor to the PC via a USB connection.

> Easy configuration to unique applications

The configuration software has more than 20 parameters that can be modified to suit the machine application. The parameters can be saved in PDF format for quick, easy reference.

> Real-time sensor performance display

One of the best functions of the new software is the ability to troubleshoot and visualize the effects of the parameters on the configured sensor. The "echo display" function shows the exact position of any false echoes. The recording function can record the values of the echoes in an .xlsx or .xml file for extended periods of time.

> Quick duplication of programmed settings

Optimal parameters set on one sensor can be saved and loaded on other units of the same reference. This function reduces time and effort.

> The interface can be used to configure specific configurable models of XX ultrasonic sensors (XXS●●, XXA●● & XXW54P3●●●).

- 1: Power supply, provided with 4 adapters
- 2: Configuration interface **XXZBOX01**
- 3: XX Configuration Software, installed on a PC
- 4: Ultrasonic sensor **XXS●●**, **XXA●●** or **XXW54P3●●●**.
- 5: M12-M12 cable or Deutsch DTM04-M12.

XX Configuration Software for ultrasonic sensors

> XX Configuration Software is available in English, French, German, Spanish, Italian, and Chinese. It can be downloaded directly from the website www.tesensors.com.

> Recommended PC performance:

- > Windows OS: 7 SP1 embedded standard(x86 & x64), 8.1 (x86 & x64), or 10 (x86 & x64)
- > Internet Explorer: 9.0 or higher
- > Disk space: 1 GB or higher
- > RAM memory: 2 GB or higher
- > Processor speed: 1 GHz or higher
- > Display resolution: 1360 x 768 or higher

Configuration software presentation

Principle

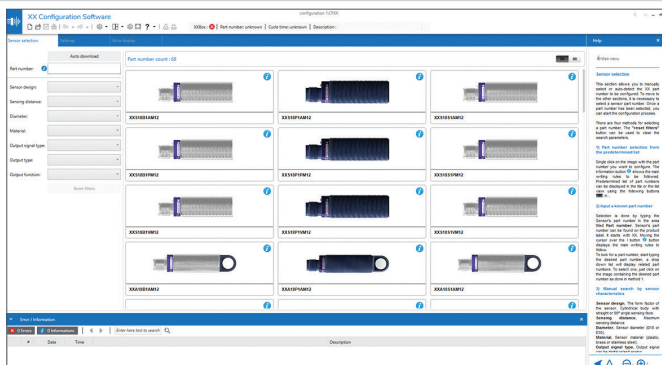

- 1: Power supply, provided with 4 adapters
- 2: Configuration interface **XXZBOX01**
- 3: XX Configuration Software, installed on a PC
- 4: Ultrasonic sensor **XXS**●●, **XXA**●● or **XXW54P3**●●●.

Setting examples

Sensor selection

- > This page is used to manually select or auto-download the XX reference sensor to be configured. Once a reference has been selected, the user can start the configuration process.
- > There are 4 methods of selection. The **Reset search** button can reinitialize the search, regardless of the method used.
 - 1: Direct selection from the full reference list
 - 2: Selection through reference
 - 3: Manual search using criteria
 - 4: Automatic sensor detection

Detection settings

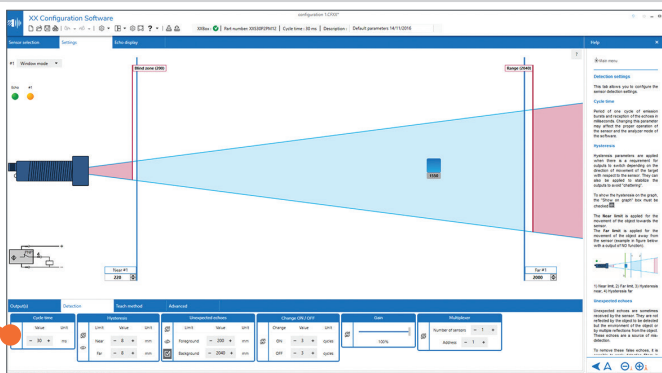

- > This tab is used to configure the sensor detection settings.

Hysteresis		
Limit	Value	Unit
Near	- 4 +	mm
Far	- 4 +	mm

Unexpected echoes		
Limit	Value	Unit
Foreground	- 100 +	mm
Background	- 1020 +	mm

Change ON / OFF		
Change	Value	Unit
ON	- 3 +	cycles
OFF	- 3 +	cycles

Multiplexer	
Number of sensors	- 1 +
Address	- 1 +

Output settings

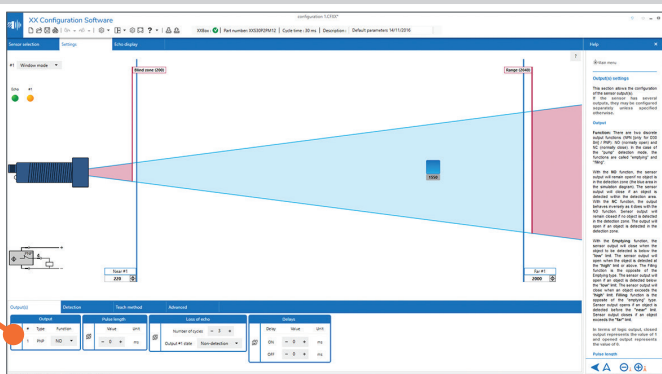

- > This page enables the configuration of sensor outputs. If the sensor has several outputs, they may be configured separately, unless specified otherwise.

Output		
#	Type	Function
1	PNP	NO

Pulse length	
Value	Unit
- 0 +	ms

Loss of echo	
Number of cycles	- 3 +
Output #1 state	Non-detection

Delays		
Delay	Value	Unit
ON	- 0 +	ms
OFF	- 0 +	ms

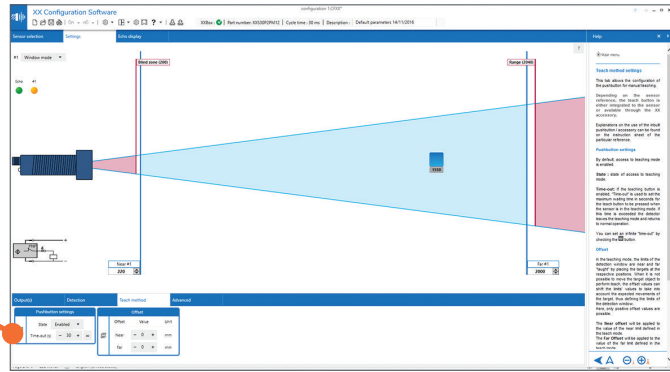

Configuration software presentation (continued)

Setting examples (continued)

Teach method settings

- > This tab allows the configuration of the pushbutton for manual teaching. Depending on the sensor reference, the teach button is either integrated in the sensor or available through the teach pushbutton **XXZPB100** (see page 43).

Echo display mode

- > With the “echo display” mode, the user can visualize several echoes received by the sensor in the same cycle.
- > The first valid echo is shown in blue and the others in gray. The blue echo is what the sensor considers as the detected object.
- > It is also possible to record the data over extended periods of time using the “record” function.

Measure mode

- > The “measure” button opens a pop-up window giving a real-time numerical display of the position of the object in mm or inches.

Characteristics

Supply characteristics

Rated supply voltage (Ue) with protection against reverse polarity	V	24 V $\overline{\text{DC}}$
Voltage limits	V	14...30 V $\overline{\text{DC}}$ (ripple: 10% max)
Consumption	W	4 (consumption excluding sensor)

LED indicators

LED indicators	Power supply	Green LED
	PC communication	Orange LED
	Error	Red LED

Communication

Data communication baud rate	bps	19,200
------------------------------	------------	--------

Connection

Maximum cabling distance between sensor and interface	m	3
Electrical connection to sensor		M12 female connector
Connection to PC or laptop		0.5 m USB cable , A type connector

Environment characteristics

Compliance to regulations		CE
Degree of protection	Conforming to IEC 60529	IP 40
Storage temperature	$^{\circ}\text{C}$	-20...+45
Operating temperature	$^{\circ}\text{C}$	0...+45
Relative humidity		< 95%, without condensation

Dimensions

- (1) Male M12 connector, 5-pin: power supply
 (2) Female M12 connector, 5-pin: sensor
 (3) Cable length: 0.5 m (USB cable A type connector): PC

Connections

Interface connector for power supply adapter (M12 male)

Pin number	Wire color	Description
1	BN: Brown	+14...30 V $\overline{\text{DC}}$
2	WH: White	Output 2 (4) (5)
3	BU: Blue	0 V $\overline{\text{DC}}$
4	BK: Black	Output 1 (4)
5	-	Not used (6)

Interface connector for sensor (M12 female)

Pin number	Description
1	Power out to sensor
2	Software communication
3	0 V $\overline{\text{DC}}$
4	Software communication
5	Not used (6)

(4) Output is only active during the "echo display" mode and "measure" mode.

(5) Output 2 is not available on all sensors.

(6) The 5th pins of the M12 male and M12 female connectors are electrically connected to one another.

References of accessories

Cabling accessories

Connectors	For use with sensor	Type of connection		Reference	Weight kg
